Aperçu généré par IA

To display a table entry alongside its column headers, use a standard `SELECT` **statement** specifying the desired columns or utilizing the `*` wildcard.

Pure SQL (The Standard Approach)

By default, any standard SQL client interface or command-line tool automatically prints column headers at the very top of your query results. Stack Overflow

sql

```sql
SELECT column1, column2, column3
FROM your_table_name
WHERE condition_to_find_entry;
```

Utilisez le code avec précaution.

Hardcoding Custom Headers (The UNION Method)

If you are exporting to a raw text file or a interface that strips out headers, you can manually force a header row using a `UNION ALL` query. You must ensure all columns are cast to text or compatible types: SQLServerCentral +1

sql

```sql
-- The Header Row
SELECT 'Header Name 1' AS col1, 'Header Name 2' AS col2

UNION ALL

-- The Table Entry (Data Row)
SELECT CAST(column1 AS VARCHAR), CAST(column2 AS VARCHAR)
```

```
FROM your_table_name
WHERE id = 1;
```

Utilisez le code avec précaution.

Command-Line Environment Tweaks

If you are running queries from a terminal window and headers are hidden, you can turn them back on using environment settings:

- **PostgreSQL (`psql`)**: Type `\t off` to toggle headers on.
- **SQLite**: Type `.headers on` before running your query.
- **MySQL**: By default, headers are on. If they are missing, verify you are not using the `-N` (or `--skip-column-names`) flag when launching your database shell.

GUI Tool Shortcuts (Excel/SSMS/SQL Developer)

If you want to copy an entry out of a software interface like SQL Server Management Studio or Oracle SQL Developer with its header intact, do not use standard copying. Instead, highlight your row, right-click, and choose **"Copy with Headers"** (or use the hotkey `Ctrl + Shift + C`). Stack Overflow +2

Which database system or client tool (**MySQL, PostgreSQL, SSMS, etc.**) are you currently using to run your query?
